## *Bioinformatics Support for Immunology Community*

- Investigators must be able to **extract meaningful information from the vast amounts of data** generated from advanced research technologies
- This requires the **collection, integration and analysis of research data from numerous, diverse sources, and their long-term storage in sustainable databases**
- To facilitate these processes, the scientific community must work to jointly develop essential **minimum information sets** and **shared vocabularies** for experiment records and knowledge description
- In response to these needs, the NIAID/NIH funded the **Bioinformatics Integration Support Contract (BISC)** to provide advanced IT support in the production, analysis, archiving, exchange and integration of genomic, proteomic and related data
- The **users of BISC** include NIAID/DAIT programs that conduct:
  - basic scientific research of immune system development and function
  - genetic determinants of immune disease
  - clinical trials to evaluate the safety, toxicity, and efficacy of immune disease therapies
  - studies of the underlying mechanisms of therapeutic agents
- Immunology Database and Analysis Portal - *ImmPort* - [www.immport.org](http://www.immport.org)

## *HLA & Immune Disease Program*

### **HLA Region Genetics in Immune-Mediated Diseases**

*Objective* - To support prospective and/or retrospective studies to investigate the role of HLA genetics in susceptibility to or protection from immune-mediated diseases, including autoimmune diseases and primary immunodeficiency diseases, GVHD, and graft rejection or survival in solid organ, tissue and cell transplantation.

*Data handling* - generate high quality HLA-disease association data for public use that will be submitted to and maintained by dbMHC through the National Center for Biomedical Information (NCBI). Analysis of data results and data submission to dbMHC will be performed through the NIAID Bioinformatics Information Support Contract (BISC)

## ImmPort

Welcome to ImmPort version 1.4.1! The ImmPort system provides advanced information technology support in the production, analysis, archiving, and exchange of scientific data for the diverse community of life science researchers supported by NIAID/DAIT. It serves as a long-term, sustainable archive of data generated by investigators funded through the NIAID/DAIT.

We welcome any comments/suggestions from our users. If you wish to provide feedback on the use of ImmPort, Please feel free to contact us by email at [helpdesk@immport.org](mailto:helpdesk@immport.org)

## *ImmPort Overview - System Components*

- **Semi-public web-based database and analysis portal**
  - Multi-level access control
  - Data sharing
- **Data**
  - **Reference data**
    - **Types** - Gene structure, protein function, polymorphisms, metabolic, regulatory, signaling and other networks, protein-protein, gene-gene, host-pathogen interactions
    - **Sources** - NCBI, Uniprot, Swissprot, BIND, Reactome
  - **Experiment data**
    - **Metadata** (defining how the experiment was performed) - common features of all experiments
    - **Primary results** - from all experiment measurement techniques
    - **Processed results**
      - Interpreted results
      - Analytical metadata
  - **Clinical trial data**
- **Query tools**
  - To support retrieval of reference and experiment data based on specified criteria
  - Pre-defined QBE
  - Customized semantic queries
- **Ontology**
  - Thesaurus function
  - Organize terms and define relationships
- **Analysis tools**
  - **Genetic analysis**
    - LD analysis
    - TagSNP selection
    - Haplotype reconstruction
    - Genotype-phenotype association
  - **Gene expression analysis**
    - Filtering/normalization
    - Clustering
    - Classification
  - **Cell population analysis**
    - Standard FACS statistics
    - Novel population identification based on high dimensional data clustering
  - **Measurement of immune response (e.g., ELISA, ELISPOT)**
    - Statistical analysis of distributions
  - **Biological network analysis**
    - Quantification of topological parameters
    - Module identification
- **Visualization tools**
  - Genome display, including genes, introns, exons, SNPs, tagSNPs, etc.
  - Genetic analysis results
  - Gene expression results
  - Networks, pathways, and molecular interactions
  - Graphing and charting of statistical results

## *DAIT Interoperability Working Group*

- In February of 2006, DAIT held a Bioinformatics Summit. One of the recommendations of the summit was to establish a committee to develop and support the use of informatics standards to facilitate interoperability among DAIT-funded programs.
- The DAIT Interoperability Steering Committee (DISC) was established in December 2006.
- Two initial projects were established
  - HLA ontology
  - Clinical trial ontology/data model

## *Use cases*

- Is there a significant association between any HLA allele and \_\_\_\_\_?
- Is there a significant association between any HLA genotype and \_\_\_\_\_?
- Is there a significant association between any HLA haplotype and \_\_\_\_\_?
- Is there a significant association between any HLA allele group and \_\_\_\_\_?

## Type 1 Diabetes

The disease mainly occurs in individuals carrying a genetic predisposition. A number of genes across the genome have been linked to diabetes susceptibility (insulin, CTLA-4, etc.) Among these, genes in the HLA (MHC) complex on chromosome 6p account for about 50% of the genetic susceptibility. The HLA class II DR and DQ loci appear as primary determinants of predisposition to and protection from T1D. However, class II genes cannot explain all of the linkage and association between chromosome 6p and T1D. In particular, there is evidence that HLA class I alleles (HLA-A and HLA-B) modulate disease susceptibility and its clinical features. Recent data suggest the possible presence of an additional susceptibility gene telomeric to HLA-F. Other reports have provided evidence for another susceptibility locus, independent of HLA class II genes, located near the TNF locus in the class III region.

## Goals

The overall goal of the type 1 diabetes (T1D) component of the 13th IHWG was to gain insight into additional genes within the MHC with effects on disease susceptibility and resistance. The following are the key aims of this effort:

- To capture existing data from investigators worldwide, to create a resource consisting of available HLA haplotypes and demographic/phenotypic data from patients with T1D, family members, and population matched controls.
- To make the captured data available to investigators worldwide through dbMHC. Thirty-three laboratories have joined the T1D Component of the 13th IHWG from various parts of the world. These laboratories generously shared data and DNA samples to assemble the 13th IHWG T1D Dataset, which includes samples with significant ethnic diversity from:
  - Over 3,000 patients and 2,000 population-based controls from 20 different data sets (case-control study).
  - Approximately 500 family members of patients with T1D.

- Using DNA from these data sets to identify HLA class II loci. The plan is to combine data from all loci.

## dbMHC Content

As of October 2005, dbMHC contains:

- Class II (DRB1/DQB1) gene sequences
- Microsatellite data: approximately 100 markers
- Available data on race, ethnicity, and family history

NOTE: The database includes data from:

# HLA allele hierarchy

## *Toward an HLA Ontology - Why?*

- To support data interoperability for data exchange  
- unambiguous representation
- To support meta-analysis of multiple independent studies
- To support inferential reasoning based on HLA relationships defined in the ontology structure

## *Toward an HLA Ontology - What?*

- Capture the hierarchical relationships between alleles defined by different methodologies and at different levels of resolution
- Define HLA haplotypes
- Develop procedures for adding new alleles to the HLA ontology framework
- Make information encoded in the nomenclature explicit
- Enumerate and distinguish uses of HLA data: presence, restriction, association, ...

## *Toward an HLA Ontology - Who?*

- HLA nomenclature people, specifically IMGT/HLA, Anthony Nolan Trust, WHO, dbMHC, other IHWG members
- Biomedical ontology people - SO group
- DISC HLA Working Group members - Petersdorf, Karp, Peters, Scheuermann

## *Toward an HLA Ontology - How?*

1. Review history and current status of HLA nomenclature and typing methodologies
2. Review biomedical ontology best practices, e.g. OBO Foundry
3. Review the current Sequence Ontology content and structure
4. Define HLA Ontology design principles and constraints
5. Assemble working groups
6. Define goals, timelines and milestones
7. Develop HLA ontology branches
8. Merge branches into initial HLA ontology draft
9. Vet HLA ontology draft with key stakeholders, including the IHWG/HLA, WHO, dbMHC, DISC HLA WG
10. Revise draft into HLA Allele Ontology v1.0 within the SO
11. Develop procedures for adding new alleles to framework
12. Integrate ontology information into HLA web resources like ImmPort and dbMHC
13. Submit publication

## *Other nomenclature issues*

- Genotype, allele, variant, polymorphism, haplotype
- SNP, microsatellite, VNTR
- Wildtype, normal, reference
- Genetics
  - Homozygous, heterozygous
  - Hardy-Weinberg equilibrium
  - Linkage disequilibrium
- KIR family (killer cell immunoglobulin like receptor)
